Health Profile 2011

Cornwall

This profile gives a picture of health in this area. It is designed to help local government and health services understand their community’s needs, so that they can work to improve people’s health and reduce health inequalities.

Visit the Health Profiles website for:
- Profiles of all local authorities in England
- Interactive maps – see how health varies between areas
- More health indicator information
- Links to more community health profiles and tools

Health Profiles are produced by the English Public Health Observatories working in partnership.

Cornwall at a glance

- The health of people in Cornwall is generally better than the England average. Deprivation is lower than average, however 19,210 children live in poverty. Life expectancy for both men and women is higher than the England average.
- Life expectancy is 5.7 years lower for men and 5.2 years lower for women in the most deprived areas of Cornwall than in the least deprived areas (based on the Slope Index of Inequality published on 5th January 2011).
- Over the last 10 years, all cause mortality rates have fallen. Early death rates from cancer and from heart disease and stroke have fallen and are better than the England average.
- About 18.1% of Year 6 children are classified as obese. A higher percentage than average of pupils spend at least three hours each week on school sport. Levels of GCSE attainment are worse than the England average.
- An estimated 21.0% of adults smoke and 25.0% are obese. There were 11,816 hospital stays for alcohol related harm in 2009/10 and there are 1,039 deaths from smoking each year.

Priorities in Cornwall include reducing inequalities as shown by the percentage of people in the bottom two quintiles combined which is higher than for England or South West. For more information see www.cornwallandislesofscilly.nhs.uk

Population 531,000

Deprivation: a national view

This map shows differences in deprivation levels in this area based on national quintiles (of the Index of Multiple Deprivation 2007 by Lower Super Output Area). The darkest coloured areas are some of the most deprived areas in England.

Health inequalities: a local view

This map shows differences in deprivation levels in this area based on local quintiles (of the Index of Multiple Deprivation 2007 by Lower Super Output Area). The darkest coloured areas are the most deprived areas in this area.

This chart shows the percentage of the population in England, this region, and this area who live in each of these quintiles.

This chart shows the life expectancy at birth for males and females (2005-2009) for each of the quintiles in this area.

95% confidence interval. These indicate the level of uncertainty about each value on the graph. Longer/wider intervals mean more uncertainty.
These graphs show how changes in death rates for this area compare with changes for the whole of England. Data points on the graph are mid-points of 3-year averages of yearly rates. For example the dot labelled 2003 represents the 3-year period 2002 to 2004.

Trend 1 compares rates of death, at all ages and from all causes, in this area with those for England.

Trend 2 compares rates of early death from heart disease and stroke (in people under 75) in this area with those for England.

Trend 3 compares rates of early death from cancer (in people under 75) in this area with those for England.

**Health inequalities: ethnicity**

This chart shows the percentage of pupils by ethnic group in this area who achieved five GCSEs in 2009/10 (A* to C grades including English and Maths). Comparing results may help find possible inequalities between ethnic groups.

If there are any empty cells in the table this is because data has not been presented where the calculation involved pupil numbers of 0, 1 or 2. Some further groups may not have data presented in order to prevent counts of small numbers being calculated from values for other ethnic groups or areas.
The chart below shows how the health of people in this area compares with the rest of England. This area’s result for each indicator is shown as a circle. The average rate for England is shown by the black line, which is always at the centre of the chart. The range of results for all local areas in England is shown as a grey bar. A red circle means that this area is significantly worse than England for that indicator; however, a green circle may still indicate an important public health problem.

- **Significantly worse than England average**
- **Not significantly different from England average**
- **Significantly better than England average**
