Ref: **C.S11.1 – Hot Water**

Title: **Centrally based hot water production**

Rev: 0
Date: May 2012

Where centrally based Hot Water System (HWS) production is a prudent option, the method of hot water production should be capable of being isolated completely from the heating system distribution.

Use of the same heating plant may be cost or ecologically effective to provide the primary heat for the system, particularly in the case of biomass boiler installations.
